HIGH-LEVEL SYSTEM DESIGN · NFL EVENTS HUB

NFL Events Hub — high-level system design

LEGEND

1 Step (see below) · Hub origin & BFF · Service / partner · Data store / queue · Users / authoring · Dynamic path · Static path

STATIC PATH

Every fan, one portal

1 **Resolve.** Web, NFL OnePass and the NFL App open the hub on an nfl.com subdomain (e.g. `event.nfl.com`,

DYNAMIC PATH

Only signed-in actions

5 **Route.** The CDN sends only `/auth/*` and `/api/*` to the Edge BFF; everything else stays static.

EXIT

Paid events

10 **Buy.** Paid events link out to Ticketmaster (VIP via On Location); no

proposed); apps use a WebView.

2. **Edge.** Every request lands on the CDN: cache, WAF, bot rules, and a waiting room for peak registration openings.
3. **Origin on miss.** Pages, `events.json` (all events, filters, search) and status come from AEM Edge Delivery. Most traffic stops at the cache.
4. **Publish.** Clubs and the league author in AEM; publishing purges the CDN in seconds (cancellations included).

6. **Sign in.** The BFF runs OIDC with NFL ID (OnePass hands its session to the WebView) and sets an HttpOnly cookie.
7. **Register.** The BFF forwards register / my events to the OnePass registration API with the fan's identity.
8. **Store.** The API enforces capacity and one-per-fan (an adult 18+ can add up to 5 minors, as OnePass does today), stores the registration, issues the QR and wallet pass.
9. **Notify.** Confirmations and cancellations go on a queue; the notifications worker sends email and push.

payments in the hub.
