HIGH-LEVEL DESIGN · NFL EVENTS HUB

NFL Events Hub — high-level design

OPERATIONS

CI/CD	ENV	SEC	OBS
Code	**Preview → live**	**Security**	**Observability**
GitHub → code sync	.aem.page → .aem.live	WAF · bot · rate limits	AEM telemetry · logs

LEGEND

Clients / authors · Core platform · Thin edge worker · NFL / partner · Data / operations · Signed-in path · Server-side call · Link-out

1. **Clients.** NFL OnePass and the NFL App open the hub in a WebView; the web is nfl.com and club sites. One portal for all three.
2. **Edge.** DNS → CDN. The CDN serves cached pages to everyone and sends only `/auth` and `/api` to the edge worker.
3. **Platform we build.** The NFL Events Hub on AEM Edge Delivery (authored by clubs and the league), a thin stateless edge worker, and one event registration service with its own database: registration, capacity, QR codes, check-in and wallet passes.
4. **NFL & partners.** NFL ID for sign-in, NFL notifications (email, app push) for confirmations and cancellations, Apple / Google Wallet for passes.
5. **Partners.** Paid events link out to Ticketmaster (VIP via On Location). No payments in the hub.
6. **Operations.** GitHub → code sync → preview → live; WAF and bot rules at the CDN; AEM telemetry and logs. The only data we hold is in the registration service's managed database.
