HIGH-LEVEL DESIGN · NFL EVENTS HUB

NFL Events Hub — high-level design

1. **Clients.** NFL OnePass and the NFL App open the hub in a WebView; the web is nfl.com and club sites. One portal for all three.

2. **Edge.** DNS → CDN. The CDN serves cached pages to everyone and sends only `/auth` and `/api` to the edge worker.
3. **What we build: events.nfl.com.** The NFL Events Hub on AEM Edge Delivery (authored by clubs and the league) and a thin, stateless edge worker. No database of ours.
4. **NFL & partners (existing).** NFL ID for sign-in; NFL's event registration service for registration, QR codes, check-in and wallet passes; notifications through AJO (real-time: confirmations, cancellations, reminders, push) and Adobe Campaign (batch email).
5. **Personalization.** A personalization block in hub pages uses the AEP Web SDK to get Adobe Target offers informed by Real-Time CDP audiences: browser-direct, after first paint, consent-gated. An alerts block shows live event status.
6. **Partners.** Paid events link out to Ticketmaster (VIP via On Location). No payments in the hub.
7. **Operations.** GitHub → code sync → preview → live; WAF and bot rules at the CDN; AEM telemetry and logs. Nothing to provision and no fan data stored by the hub.
